

Tool Evaluation

Tools and Production - Zoe

Tool 1 – Discord Ticket Bot

OVERVIEW

The tool allows users to:

- Submit tickets through an **interactive panel**.
- Opens a form requesting a **subject**, GitHub **branch**, detailed **description**, and optional **media** links.

Submitted reports are:

- Automatically forwarded to a private **staff-only** review channel with **role-based** access control.
- Ticket reviewers are then able to read these requests and **systematically assign** them to the correct individual for solving.

DEMAND

Without this bot:

- Requests for help may get **lost** within chat.
- Not **clear** who is solving.
- Fixes happen without team **awareness**.
- Individuals may not include their **name** and **branch**.
- **All** server members can see.
- Increased risk of **data** leak.
- Whoever is **loudest** gets seen first.

Greedy Piggies Ticket Bot APP 04/02/2026, 13:30

Support Tickets

Press **Submit Ticket** to send an issue to the team.

GitHub branch is required for technical tracking.
If you have screenshots or videos, paste **links** (Google Drive, OneDrive, Dropbox, Imgur, etc.) in the form.

Submit Ticket

Zoe E KRBY 04/02/2026, 14:19

@L5-Animation @L5-Art @L5-Design @L5-Dev

feel free to submit tickets here if you encounter any issues when working on this project! all tickets will be forwarded to a small team who will try their best to get it solved but are otherwise confidential 🙌

👍 1 🗨

Tool 1 – Security

POSSIBLE RISKS

Unauthorised Access

Incorrect Discord permissions could allow non-reviewers to access private tickets.

Impact:

- exposure of player reports
- leaked internal discussions
- reputational damage

Mitigation:

- role-based access control (Ticket Reviewer) ✓
- private channels only ✓
- deny @everyone permissions by default ✓
- periodic permission audits ✗

Bot Token Compromise

The Discord bot token could be leaked.

Impact:

- Attackers read tickets
- impersonation of bot
- deletion/modification of records.

Mitigation:

- never upload tokens to GitHub ✓
- store token in .env file ✓
- rotate token if exposed
- restrict bot permissions to minimum required scope ✓

Data Leakage Through Files

Users may upload sensitive information and leak data.

Impact:

- crash logs containing system info
- personal information
- unreleased assets

Mitigation:

- restrict upload visibility to reviewers ✓
- guidance message warning users not to submit personal data ✗
- limit accepted file types where possible ✗

✓ - have done

✗ - possible improvement

Tool 1 – GDPR

POSSIBLE RISKS

Data Retention Risk

Ticket data may be stored indefinitely within Discord channels.

Impact:

- **unnecessary** storage of personal data
- increased **breach exposure** over time
- non-compliance with GDPR **storage limitation** principle

Mitigation:

- automatically archive/delete resolved tickets after set period
- define retention policy (e.g. 30–90 days)
- remove inactive ticket channels regularly

Lack of User Transparency

Users may not understand how their submitted data is used.

Impact:

- unlawful **data processing**
- reduced **user trust**
- GDPR **transparency** violation

Mitigation:

- ticket panel privacy notice
- inform users submissions are visible to reviewers
- provide short data-usage statement before submission

Third-Party Data Processing

Data is processed through Discord infrastructure.

Impact:

- reliance on **external platform** security
- **cross-border** data processing risks

Mitigation:

- rely on **Discord GDPR** compliance framework
- avoid exporting ticket **data externally**
- minimise **long-term local** storage

Tool 1 – Possible Improvements

SMART TICKET CATEGORISATION

The bot **analyses** ticket text and **categorises** it.

These categories could have **specific** reviewers that are then pinged.

E.g. GitHub managers for Git issues, sound leads for audio issues.

This would need the bot to use **Native Language Processing (NLP)** to interpret human language and tag accordingly.

AI tagging allows the system to **scale** without increasing moderator workload.

Could also be used for **urgency** tagging.

LIVE DEVELOPMENT DASHBOARD

Ticket data is **automatically** transformed into **visual analytics** showing **project health** and **development trends** in real time.

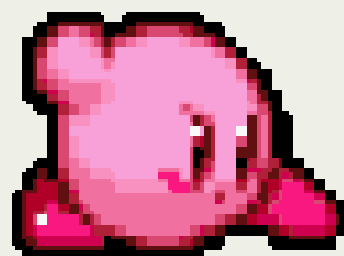

Could highlight most reported **bugs, systems** generating **repeated** issues, **spike detection** after new builds etc.

Allows dev to know **exactly** what to work on based off the most prevalent issues.

Work **distribution imbalance** is easier to spot

E.g. art department is overwhelmed.

Perfect for **new patch/builds** to show project status.

Tool 2 – Discord Audio Submit Bot

OVERVIEW

The tool allows users to:

- Submit audio assets through a **slash command**.
- Opens a form requesting a **.wav** file, **contributor** name, **description**, and **category**.

Submitted assets are:

- Automatically uploaded and pushed to the group **GitHub**, where they are **sorted** into file based off **category** selected.
- These assets are then ready to use in engine.

DEMAND

Without this bot:

- **Musicians** would have to learn GitHub. (BAD)
- Other **suboptimal upload** methods such as Discord message/Dropbox would have to be used.
- Each asset would have to be **sorted manually**.
- Assets would have to be **manually uploaded** to the game files.

Audio Submission Bot — How to Use

1. Type `/submit_audio` in this channel.

2. Fill in the form:

- Contributor → your name
 - Category → SFX, Foley, Voice Acting, or Composition
 - File → upload a .wav file
 - Title of File → clear asset name (refer to naming conventions in # documents)
 - Notes → optional context or description

3. Press **Enter** to submit.

You'll see a confirmation message when it's done (edited)

+

Message #uploads

Tool 2 – Security

POSSIBLE RISKS

Unauthorised File Uploads

Incorrect file types could be uploaded.

Impact:

- repository contamination
- disruption of development workflow

Mitigation:

- restrict file types (.wav only) ✓
- reject unsupported file types ✓

Bot Token Compromise

The Discord bot token could be leaked.

Impact:

- Attackers read tickets
- impersonation of bot
- deletion/modification of records.

Mitigation:

- never upload tokens to GitHub ✓
- store token in .env file ✓
- rotate token if exposed ✓
- restrict bot permissions to minimum required scope ✓

Repository Access Exposure

Bot has automated write access to the project repository.

Impact:

- loss of project integrity
- malicious commits introduced

Mitigation:

- use limited scope GitHub access token X
- restrict bot permissions to upload folders only X
- rotate access tokens periodically X

✓ - have done

X - possible improvement

Tool 2 – GDPR

POSSIBLE RISKS

Personal Data Within Audio File Itself

Voice acting submissions may contain identifiable voices.

Impact:

- processing of **biometric** or **identifiable personal data**
- increased **GDPR responsibility**

Mitigation:

- files used **solely for development** purposes
- contributor **agreement** or **consent** notice

Metadata Exposure

Uploaded audio files may contain embedded metadata.

Impact:

- accidental disclosure of **real names** or **device information**
- unnecessary **personal data** storage

Mitigation:

- **strip metadata** automatically before upload
- advise contributors to export **clean files**

Third-Party Data Processing

Data is processed through Discord infrastructure.

Impact:

- reliance on **external platform** security
- **cross-border** data processing risks

Mitigation:

- rely on **Discord GDPR** compliance framework
- avoid exporting ticket **data externally**
- minimise **long-term local** storage

Tool 2 – Possible Improvements

AUTOMATIC AUDIO VALIDATION + CONVERSION

The bot could **analyse** uploaded audio before accepting it.

It could confirm extra parameters such as **bit depth**, **mono/stereo**, **sample rate** and **loudness** levels.

If the file does not meet these standards, it could **reject** it or automatically **convert** it.

E.g. MP3 is converted to WAV using FFmpeg

This would prevent Unreal **import issues** and **save time** for technical audio designers.

INTELLIGENT NAMING SYSTEM

Bot generates **production-ready filenames automatically**.

*E.g. footstep final new.wav –
SFX_Footstep_Snow_Run_v01.wav*

This would help **correct human error** and ensure all Unreal files are named for easy use.

No one has to **manually** change file names and reliance is not on musicians to **follow correct naming conventions**.
